

EARTHING

Earth Seal

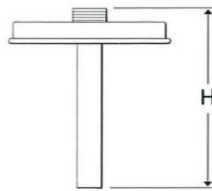

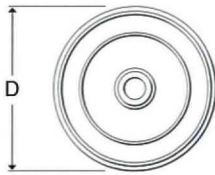

The earth seal is fitted when the earth rod connection is below the water level and where there is a possibility of water entering the inspection pit from below ground, particularly useful when the earth electrode is being installed in a basement building.

The seal is used in conjunction with the Wallis heavy duty earth housing shown on page 22.

Material:

Plastic.

Static Earth Receptacle

These units are used in open areas or anywhere a temporary earthing point may be required such as airfields or petrol stations.

The unit provides a static discharge point for aircraft, tankers, lorries or boats.
